HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Emergency Medicine, and is licensed to practice in New York. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The patient is a 49-year-old female who was injured on May 25, 2005. The patient continued to experience pain in low back and pelvic floor muscles. Physical examination was notable for tenderness of low back, especially on right, stiffness of low back, normal gait, and grossly intact sensation. Diagnoses included myalgia and myositis, neuralgia, neuritis, and radiculitis. Treatment included medications. Request for authorization for physical therapy 12 visits was submitted for consideration.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Physical Therapy - 12 visits: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Physical Medicine.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Pain Interventions and Guidelines Page(s): 98-99. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG)

Decision rationale: Chronic Pain Medical Treatment Guidelines state that there is no high-grade scientific evidence to support the effectiveness or ineffectiveness of passive physical modalities such as traction, heat/cold applications, massage, diathermy, TENS units, ultrasound, laser

treatment, or biofeedback. They can provide short-term relief during the early phases of treatment. Active treatment is associated with better outcomes and can be managed as a home exercise program with supervision. ODG states that physical therapy is more effective in short-term follow up. Patients should be formally assessed after a "six-visit clinical trial" to see if the patient is moving in a positive direction, no direction, or a negative direction (prior to continuing with the physical therapy). When treatment duration and/or number of visits exceed the guideline, exceptional factors should be noted. Recommended number of visits for myalgia and myositis is 9-10 visits over 8 weeks; and for neuralgia, neuritis, and radiculitis is 8-10 visits over 4 weeks. In this case the request for 12 visits surpasses the recommended six visits for clinical trial to determine effectiveness of treatment. The request is not medically necessary.
