HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Physical Medicine & Rehabilitation, has a subspecialty in Pain Medicine, and is licensed to practice in California. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

This is a male patient with the date of injury of May 28, 2014. A Utilization Review dated September 29, 2014 recommended non-certification of lumbar spine open MRI, physical therapy low back, EMG bilateral lower extremities, and NCV bilateral lower extremities. A Progress Report dated September 17, 2014 identifies Subjective Complaints of low back pain radiating to legs. Objective Findings identify decreased ROM lumbar spine in all directions by 25%, increased pain and muscle spasms L1-S1, Kemp's is positive. Diagnoses identify neuralgia, neuritis, and radiculitis, unspecified, and thoracic or lumbosacral neuritis or radiculitis, unspecified. Treatment Plan identifies request open MRI, refer for PT 2 x 4, and NCV/EMG for lower extremities.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Lumbar spine MRI: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303-304. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG), Low Back Chapter, MRIs (magnetic resonance imaging)

Decision rationale: Regarding the request for lumbar spine MRI, Occupational Medicine Practice Guidelines state that unequivocal objective findings that identify specific nerve compromise on the neurologic examination are sufficient evidence to warrant imaging in patients who do not respond to treatment and would consider surgery an option. When the neurologic examination is less clear, however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. ODG states that MRIs are recommended for uncomplicated low back pain with radiculopathy after at least one month of conservative therapy. Within the documentation available for review, there is no identification of any objective findings that identify specific nerve compromise on the neurologic exam. Additionally, there is no statement indicating what medical decision-making will be based upon the outcome of the currently requested MRI. In the absence of clarity regarding those issues, the currently requested lumbar spine MRI is not medically necessary.

Physical Therapy, low back, x 8: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Physical Medicine Page(s): 98-99.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 298, Chronic Pain Treatment Guidelines Page(s): 98 of 127. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG), Low Back Chapter, Physical Therapy

Decision rationale: Regarding the request for Physical Therapy, low back, x 8, Chronic Pain Medical Treatment Guidelines recommend a short course of active therapy with continuation of active therapies at home as an extension of the treatment process in order to maintain improvement levels. ODG has more specific criteria for the ongoing use of physical therapy. ODG recommends a trial of physical therapy. If the trial of physical therapy results in objective functional improvement, as well as ongoing objective treatment goals, then additional therapy may be considered. Within the documentation available for review, there is documentation of completion of prior PT sessions, but there is no documentation of specific objective functional improvement with the previous sessions and remaining deficits that cannot be addressed within the context of an independent home exercise program, yet are expected to improve with formal supervised therapy. In light of the above issues, the currently requested Physical Therapy, low back, x 8 is not medically necessary.

EMG bilateral lower extremities: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) Low Back Chapter, Electrodiagnostic Studies

Decision rationale: Regarding the request for EMG bilateral lower extremities, Occupational Medicine Practice Guidelines state that unequivocal objective findings that identify specific

nerve compromise on the neurologic exam are sufficient evidence to warrant imaging in patients who do not respond to treatment and who would consider surgery. When a neurologic examination is less clear however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. They go on to state that electromyography may be useful to identify subtle focal neurologic dysfunction in patients with low back symptoms lasting more than 3 to 4 weeks. ODG states that nerve conduction studies are not recommended for back conditions. They go on to state that there is minimal justification for performing nerve conduction studies when a patient is presumed to have symptoms on the basis of radiculopathy. Within the documentation available for review, there are no physical examination findings supporting a diagnosis of specific nerve compromise. Additionally, if such findings are present but have not been documented, there is no documentation that the patient has failed conservative treatment directed towards these complaints. In the absence of such documentation, but currently requested EMG bilateral lower extremities is not medically necessary.

NCV bilateral lower extremities: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) Low Back Chapter, Electrodiagnostic Studies

Decision rationale: Regarding the request for NCV bilateral lower extremities, Occupational Medicine Practice Guidelines state that unequivocal objective findings that identify specific nerve compromise on the neurologic exam are sufficient evidence to warrant imaging in patients who do not respond to treatment and who would consider surgery. When a neurologic examination is less clear however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. They go on to state that electromyography may be useful to identify subtle focal neurologic dysfunction in patients with low back symptoms lasting more than 3 to 4 weeks. ODG states that nerve conduction studies are not recommended for back conditions. They go on to state that there is minimal justification for performing nerve conduction studies when a patient is presumed to have symptoms on the basis of radiculopathy. Within the documentation available for review, there are no physical examination findings supporting a diagnosis of specific nerve compromise. Additionally, if such findings are present but have not been documented, there is no documentation that the patient has failed conservative treatment directed towards these complaints. In the absence of such documentation, but currently requested NCV bilateral lower extremities is not medically necessary.
