Date Assigned:	06/20/2014	Date of Injury:	05/08/2002
Decision Date:	07/17/2014	UR Denial Date:	02/21/2014
Priority:	Standard	Application Received:	03/10/2014

HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Anesthesiology, has a subspecialty in Pain Management and is licensed to practice in California. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

According to the records made available for review, this is a 49-year-old female with a 5/8/02 date of injury. At the time (2/21/14) of the Decision for caudal epidural steroid injection, there is documentation of subjective (pain radiating mostly to the left leg) and objective (none specified) findings, current diagnoses (lumbosacral neuritis, sacral disorder, lumbosacral disc degeneration, and lumbar post laminectomy syndrome), and treatment to date (right sided L5-S1 epidural steroid injection with minimal relief). There is no documentation of at least 50-70% pain relief for six to eight weeks with previous injection.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Caudal Epidural Steroid Injection: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Epidural Steroid Injection Page(s): 46.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 300. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) Low Back, Epidural Steroid Injections (ESIs).

Decision rationale: The MTUS reference to ACOEM guidelines identifies documentations of objective radiculopathy in an effort to avoid surgery as criteria necessary to support the medical

necessity of epidural steroid injections. ODG identifies documentation of at least 50-70% pain relief for six to eight weeks, with a general recommendation of no more than 4 blocks per region per year, as well as decreased need for pain medications, and functional response as criteria necessary to support the medical necessity of additional epidural steroid injections. Within the medical information available for review, there is documentation of diagnoses of lumbosacral neuritis, sacral disorder, lumbosacral disc degeneration, and lumbar post laminectomy syndrome. In addition, there is documentation of right sided L5-S1 epidural steroid injection with minimal relief. However, there is no documentation of at least 50-70% pain relief for six to eight weeks with previous injection. Therefore, based on guidelines and a review of the evidence, the request for caudal epidural steroid injection is not medically necessary.
