HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Family Medicine and is licensed to practice in Arizona. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

Patient is a 51 year old female with a date of injury on 5/15/2013. Diagnoses include left shoulder strain, and bilateral carpal tunnel syndrome. Subjective complaints are of persistent bilateral wrist pain with radiation to both arms, and left shoulder pain. Physical exam shows positive callous and positive Phalen's signs bilaterally. Treatment has included medication and activity modification. Medications include Norco, Diclofenac XR 100mg, Methyl Salicylate, and Prilosec.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Prilosec 20mg #80: Overturned

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Page(s): 47.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines NSAIDS/ GI RISK Page(s): 67-68. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) PAIN, PPIs.

Decision rationale: According to CA MTUS guidelines, a proton pump inhibitor (PPI) can be added to NSAID therapy if the patient is at an intermediate to high risk for adverse GI events. Guidelines identify the following as risk factors for GI events: age >65, history of peptic ulcer,

GI bleeding or perforation, use of ASA, corticosteroids, anticoagulant use, or high dose NSAIDs. The ODG suggests that PPIs are highly effective for their approved indications, including preventing gastric ulcers induced by NSAIDs. This patient is on chronic NSAID therapy, and is using omeprazole for GI prophylaxis. Therefore, the use of omeprazole is consistent with guideline recommendations and is medically necessary.
