HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Neurology, has a subspecialty in Neuromuscular Medicine and is licensed to practice in New Jersey. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The patient is a 48-year-old man who sustained a work-related injury on April 11, 2006. Subsequently, the patient developed a chronic back pain. According to a progress report dated on April 7 2014, the patient was complaining of to have ongoing back pain with a severity rated 7-10 over 10 with depression and anxiety. The patient physical examination demonstrated positive straight leg rising bilaterally, severe tenderness over the lower facet joints and sacroiliac joints. The patient was diagnosed with the failed lumbar back surgery syndrome, lumbar radiculopathy and chronic pain syndrome. The provider requested authorization for lumbar epidural steroid injection.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Lumbar Epidural Steroid Injection at L3-4: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Epidural Steroid Injections.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 309.

Decision rationale: According to MTUS guidelines, epidural steroid injection is optional for radicular pain to avoid surgery. It may offer short term benefit; however there is no significant

long term benefit or reduction for the need of surgery. Furthermore, the patient file does not document that the patient is candidate for surgery. In addition, there is no evidence that the patient has been unresponsive to conservative treatments. Furthermore, there is no recent clinical and objective documentation of radiculopathy including MRI or EMG/NCV findings. MTUS guidelines does not recommend epidural injections for back pain without radiculopathy. There is no clear documentation of radiculopathy at the level of L3-4. Therefore, Lumbar Epidural Steroid Injection at L3-4 is not medically necessary.
