HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Neurology, has a subspecialty in Neuromuscular Medicine and is licensed to practice in New Jersey. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The patient is a 53-year-old man who sustained a work-related injury on November 2, 2004. Subsequently, the patient developed a chronic back pain. According to a progress report dated on September 29, 2014, the patient was complaining of right shoulder and low back pain. The patient physical examination demonstrated lumbar tenderness with reduced range of motion and positive Lasegue bilaterally. The patient was diagnosed with status post lumbar fusion. The provider requested authorization for lumbar epidural steroid injection.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Lumbar Epidural Steroid Injection Bilateral L4-L5 L5-S1: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Epidural steroid injections (ESIs) Page(s): 46.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 309.

Decision rationale: According to MTUS guidelines, epidural steroid injection is optional for radicular pain to avoid surgery. It may offer short term benefit, however there is no significant long term benefit or reduction for the need of surgery. Furthermore, the patient file does not document that the patient is candidate for surgery. In addition, there is no evidence that the

patient has been unresponsive to conservative treatments. Furthermore, there is no recent clinical and objective documentation of radiculopathy including MRI or EMG/NCV findings. MTUS guidelines does not recommend epidural injections for back pain without radiculopathy. There is no clear documentation of radiculopathy at the level of L4-S1. Therefore, Lumbar Epidural Steroid Injection Bilateral L4-L5 L5-S1 is not medically necessary.
