Date Assigned:	12/03/2014	Date of Injury:	02/06/2008
Decision Date:	01/20/2015	UR Denial Date:	10/22/2014
Priority:	Standard	Application Received:	11/21/2014

HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Physical Medicine and Rehabilitation, has a subspecialty in Pain Management and is licensed to practice in California. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

This is a male patient with the date of injury of February 6, 2008. A Utilization Review dated October 22, 2014 recommended non-certification of MRI without contrast of right shoulder. A Progress Report dated October 15, 2014 identifies Subjective Complaints of constant pain anterior shoulder. Objective Complaints identify positive Speed's test, tender long head of biceps. AROM WNL. Diagnoses identify chronic pain syndrome, bilateral shoulder bicipital tendinosis. Treatment Plan identifies MRI right shoulder.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

MRI of the right shoulder without contrast: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 9 Shoulder Complaints Page(s): 207 - 209.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 9 Shoulder Complaints Page(s): 207-209. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG), Shoulder Chapter, Magnetic resonance imaging (MRI)

Decision rationale: Regarding the request for MRI of the right shoulder without contrast, Occupational Medicine Practice Guidelines state that more specialized imaging studies are not recommended during the 1st month to 6 weeks of activity limitation due to shoulder symptoms

except when a red flag is noted on history or examination. Cases of impingement syndrome are managed the same whether or not radiographs show calcium in the rotator cuff or degenerative changes are seen in or around the glenohumeral joint or AC joint. Guidelines go on to recommend imaging studies for physiologic evidence of tissue insult or neurovascular dysfunction, failure to progress in a strengthening program intended to avoid surgery, and clarification of the anatomy prior to an invasive procedure. ODG recommends MRI of the shoulder for subacute shoulder pain with suspicion of instability/labral tear or following acute shoulder trauma with suspicion of rotator cuff tear/impingement with normal plain film radiographs. Within the documentation available for review, it does not appear the patient has failed conservative treatment options. Furthermore, it is unclear how an MRI will change the patient's current treatment plan. In the absence of clarity regarding those issues, the currently requested MRI of the right shoulder without contrast is not medically necessary.
