HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: North Carolina

Certification(s)/Specialty: Family Practice

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 52-year-old male who sustained an industrial injury on March 24, 2000. Previous treatment includes lumbar spine fusion and laminectomy, lumbar radiculopathy, and medications. Currently the injured worker complains of lower backache and left knee pain. He reports that his medications are working well. The injured worker is prescribed valium for anxiety and muscle spasm and notes that the medication is effective in reducing anxiety, muscle spasm and indirectly his pain. The injured worker reported more pain since the initiation of tapering his Valium and noticing more muscle spasms and tightness. Diagnoses associated with the request include anxiety and muscle spasm. The treatment plan includes continuation of medications to include Valium, Wellbutrin, MS Contin, Norco, and Trazodone.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Valium 5mg #24: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Benzodiazepines.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines benzodiazepines Page(s): 22.

Decision rationale: The California chronic pain medical treatment guidelines section on benzodiazepines states: Benzodiazepines. Not recommended for long-term use because long-term efficacy is unproven and there is a risk of dependence. Most guidelines limit use to 4 weeks. Their range of action includes sedative/hypnotic, anxiolytic, anticonvulsant, and muscle relaxant. Chronic benzodiazepines are the treatment of choice in very few conditions. Tolerance to hypnotic effects develops rapidly. Tolerance to anxiolytic effects occurs within months and long-term use may actually increase anxiety. A more appropriate treatment for anxiety disorder is an antidepressant. Tolerance to anticonvulsant and muscle relaxant effects occurs within weeks. (Baillargeon, 2003) (Ashton, 2005) The chronic long-term use of this class of medication is recommended in very few conditions per the California MTUS. There is no evidence however of failure of first line agent for the treatment of anxiety in the provided documentation. For this reason, the request is not medically necessary.
