HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: Georgia

Certification(s)/Specialty: Anesthesiology, Pain Management

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 63 year old female, who sustained an industrial injury on 3/7/2002. Diagnoses have included radiculopathy and osteoarthritis. Treatment to date has included medication. According to the progress report dated 5/14/2015, the injured worker complained of lower back pain. Pain scale was 9/10. No physical exam was documented. Current medications included Oxycodone. Authorization was requested for bilateral lower extremity electromyography (EMG) and Oxycodone.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Bilateral lower extremity EMG: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) Low Back Pain: Diagnostic Consideration: EMG.

Decision rationale: Bilateral lower extremity EMG is not medically necessary. When the neurologic examination is less clear, however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. Indiscriminant imaging will result in false-positive findings, such as disk bulges, that are not the source of painful symptoms and do not warrant surgery. If physiologic evidence indicates tissue insult or nerve impairment, the practitioner can discuss with a consultant the selection of an imaging test to define a potential cause (magnetic resonance imaging [MRI] for neural or other soft tissue, computer tomography [CT] for bony structures). Electromyography (EMG), including H-reflex tests, may be useful to identify subtle, focal neurologic dysfunction in patients with low back symptoms lasting more than three or four weeks. The enrollee has chronic radiculitis confirmed by physical exam, and MRI. There is no indication for an EMG on the bilateral lower extremity; therefore, the request is not medically necessary.

Oxycodone HCL 5mg #60: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids Page(s): 79.

Decision rationale: Oxycodone HCL 5 mg #60 is not medically necessary. Per MTUS Page 79 of MTUS guidelines states that weaning of opioids are recommended if (a) there are no overall improvement in function, unless there are extenuating circumstances (b) continuing pain with evidence of intolerable adverse effects (c) decrease in functioning (d) resolution of pain (e) if serious non-adherence is occurring (f) the patient requests discontinuing. The claimant's medical records did not document that there was an overall improvement in function or a return to work with previous opioid therapy. The claimant has long-term use with this medication and there was a lack of improved function with this opioid; therefore, the requested medication is not medically necessary.
