

Case Number:	CM15-0149436		
Date Assigned:	08/05/2015	Date of Injury:	11/25/2010
Decision Date:	09/02/2015	UR Denial Date:	07/02/2015
Priority:	Standard	Application Received:	07/24/2015

HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: North Carolina
 Certification(s)/Specialty: Family Practice

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 59 year old male, who sustained an industrial injury on 11-25-2010 secondary to a trip and fall, resulting in injury to left knee and spine. On provider visit dated 05-16-2015 the injured worker has reported back pain and leg pain. On examination of the lumbosacral spine revealed spasms in the paraspinous muscles and tenderness to palpation of the lumbar paraspinous muscles. Decreased sensation to the S1 dermatome on the right and straight leg raise was positive on the right. The diagnoses have included lumbar spinal stenosis L4-L5 and L5 - S1 with bilateral leg radiculopathy and neurogenic claudication. The injured worker was noted to be temporarily totally disabled. Treatment to date has included home exercise program, use of cane and medication. The provider requested lumbar spine MRI with closed 1.5 tesla magnet and follow up office visit with treating physician.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Lumbar Spine MRI with Closed 1.5 Tesla Magnet: Upheld

Claims Administrator guideline: The Claims Administrator did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG).

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints
Page(s): 303-304.

Decision rationale: The ACOEM chapter on low back complaints and special diagnostic studies states: Unequivocal objective findings that identify specific nerve compromise on the neurologic examination are sufficient evidence to warrant imaging in patients who do not respond to treatment and who would consider surgery an option. When the neurologic examination is less clear, however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. Indiscriminant imaging will result in false-positive findings, such as disk bulges, that are not the source of painful symptoms and do not warrant surgery. If physiologic evidence indicates tissue insult or nerve impairment, the practitioner can discuss with a consultant the selection of an imaging test to define a potential cause (magnetic resonance imaging [MRI] for neural or other soft tissue, computed tomography [CT] for bony structures). Relying solely on imaging studies to evaluate the source of low back and related symptoms carries a significant risk of diagnostic confusion (false positive test results) because of the possibility of identifying a finding that was present before symptoms began and therefore has no temporal association with the symptoms. Techniques vary in their abilities to define abnormalities (Table 12-7). Imaging studies should be reserved for cases in which surgery is considered or red-flag diagnoses are being evaluated. Because the overall false-positive rate is 30% for imaging studies in patients over age 30 who do not have symptoms, the risk of diagnostic confusion is great. There is no recorded presence of emerging red flags on the physical exam. There is evidence of nerve compromise on physical exam but there is not mention of consideration for surgery or complete failure of conservative therapy. For these reasons, criteria for imaging as defined above per the ACOEM have not been met. Therefore, the request is not medically necessary.

Follow-Up Office Visit with Treating Physician: Overturned

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) medical reevaluation.

Decision rationale: The ACOEM and the California MTUS do not specifically address the requested service as prescribed. The ODG states medical follow up visits are based on need due to continued symptoms and failure of response to treatment or ongoing symptoms that require continued treatment. This patient has continued back pain and therefore a follow up visit would be medically necessary.
