HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: California, Indiana, Oregon
 Certification(s)/Specialty: Orthopedic Surgery

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 35 year old female who sustained an industrial injury on 1-4-14. The injured worker reported "right greater than left shoulder pain." A review of the medical records indicates that the injured worker is undergoing treatments for right shoulder impingement syndrome, right shoulder acromioclavicular joint osteoarthritis, chronic depression. Provider documentation dated 9-23-15 noted the work status as temporary totally disabled. Treatment has included status post left subacromial decompression; status post left shoulder arthroscopic distal clavicle resection, physical therapy, injection therapy, Tramadol, and anti-inflammatory medications. Objective findings dated 9-23-15 were notable right upper extremity for positive Neer's and Hawkins impingement signs, acromioclavicular joint tenderness to palpation, left upper extremity acromioclavicular joint nontender to palpation. The original utilization review (9-29-15) denied a request for Associated surgical service: sling with abduction pillow, Associated surgical service: compression-cold therapy - 2 week rental, Associated surgical service: medical clearance - consult, Associated surgical service: chest x-ray - PA, Associated surgical service: electrocardiogram, Associated surgical service: blood work – PT - Partial Thromboplastin Time, and Associated surgical service: blood work - Urinalysis.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Associated surgical service: sling with abduction pillow: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) shoulder.

Decision rationale: CA MTUS/ACOEM is silent on the issue of abduction pillow. Per the ODG criteria, abduction pillow is recommended following open repair of large rotator cuff tears but not for arthroscopic repairs. In this case, there is no indication for need for open rotator cuff repair and therefore request is not medically necessary.

Associated surgical service: compression/cold therapy - 2 week rental: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) shoulder.

Decision rationale: CA MTUS/ACOEM is silent on the issue of shoulder cryotherapy. According to ODG Shoulder Chapter, Continuous flow cryotherapy, it is recommended immediately postoperatively for up to 7 days. In this case, the requested duration exceeds the guideline recommendations and the request is therefore not medically necessary.

Associated surgical service: medical clearance - consult: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) shoulder.

Decision rationale: CA MTUS/ACOEM is silent on the issue of preoperative clearance and testing. ODG, Low back, Preoperative testing general, is utilized. This chapter states that preoperative testing is guided by the patient's clinical history, comorbidities and physical examination findings. ODG states, "These investigations can be helpful to stratify risk, direct anesthetic choices, and guide postoperative management, but often are obtained because of protocol rather than medical necessity. The decision to order preoperative tests should be guided by the patient's clinical history, comorbidities and physical examination findings. Patients with signs or symptoms of active cardiovascular disease should be evaluated with appropriate testing, regardless of their preoperative status." Preoperative ECG in patients without known risk factor for coronary artery disease, regardless of age, may not be necessary. CBC is recommended for surgeries with large anticipated blood loss. Creatinine is recommended for patient with renal failure. Electrocardiography is recommended for patients undergoing high-risk surgery and those undergoing intermediate risk surgery who have additional risk factors. Patients undergoing low risk surgery do not require electrocardiography. Based on the information provided for review, there is no indication of any of these clinical scenarios present in this case. In this case the patient is healthy without comorbidities or physical examination findings concerning to warrant preoperative testing prior to the proposed surgical procedure. Therefore, the request is not medically necessary.

Associated surgical service: chest x-ray - PA: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) shoulder.

Decision rationale: CA MTUS/ACOEM is silent on the issue of preoperative clearance and testing. ODG, Low back, Preoperative testing general, is utilized. This chapter states that preoperative testing is guided by the patient's clinical history, comorbidities and physical examination findings. ODG states, "These investigations can be helpful to stratify risk, direct anesthetic choices, and guide postoperative management, but often are obtained because of protocol rather than medical necessity. The decision to order preoperative tests should be guided by the patient's clinical history, comorbidities and physical examination findings. Patients with signs or symptoms of active cardiovascular disease should be evaluated with appropriate testing, regardless of their preoperative status." Preoperative ECG in patients without known risk factor for coronary artery disease, regardless of age, may not be necessary. CBC is recommended for surgeries with large anticipated blood loss. Creatinine is recommended for patient with renal failure. Electrocardiography is recommended for patients undergoing high risk surgery and those undergoing intermediate risk surgery who have additional risk factors. Patients undergoing low risk surgery do not require electrocardiography. Based on the information provided for review, there is no indication of any of these clinical scenarios present in this case. In this case the patient is healthy without comorbidities or physical examination findings concerning to warrant preoperative testing prior to the proposed surgical procedure. Therefore, the request is not medically necessary.

Associated surgical service: EKG: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) shoulder.

Decision rationale: CA MTUS/ACOEM is silent on the issue of preoperative clearance and testing. ODG, Low back, Preoperative testing general, is utilized. This chapter states that preoperative testing is guided by the patient's clinical history, comorbidities and physical examination findings. ODG states, "These investigations can be helpful to stratify risk, direct anesthetic choices, and guide postoperative management, but often are obtained because of protocol rather than medical necessity. The decision to order preoperative tests should be guided by the patient's clinical history, comorbidities and physical examination findings. Patients with signs or symptoms of active cardiovascular disease should be evaluated with appropriate testing, regardless of their preoperative status.
