HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: New Jersey

Certification(s)/Specialty: Family Practice

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 47 year old male who sustained an industrial injury on 9/2/13. The injured worker reported symptoms in the back and lower extremities. The diagnoses included lumbar diskogenic pain and right lower extremity radicular symptoms. Treatments to date include epidural steroid injection, transcutaneous electrical nerve stimulation unit and nonsteroidal anti-inflammatory drugs. In a progress note dated 1/30/15 the treating provider reports the injured worker was "tender to palpitation in the L4 through S1 paraspinals bilaterally." On 2/9/15 Utilization Review non-certified the request for a magnetic resonance imaging of the lumbar spine. The California Medical Treatment Utilization Schedule was cited.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

MRI of the lumbar spine: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints. Decision based on Non-MTUS Citation Official Disability Guidelines.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 296-310. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG), Low Back section, MRI.

Decision rationale: MTUS Guidelines for diagnostic considerations related to lower back pain or injury require that for MRI to be warranted there needs to be unequivocal objective clinical findings that identify specific nerve compromise on the neurological examination (such as sciatica) in situations where red flag diagnoses (cauda equina, infection, fracture, tumor, dissecting/ruptured aneurysm, etc.) are being considered, and only in those patients who would consider surgery as an option. In some situations where the patient has had prior surgery on the back, MRI may also be considered. The MTUS also states that if the straight-leg-raising test on examination is positive (if done correctly) it can be helpful at identifying irritation of lumbar nerve roots, but is subjective and can be confusing when the patient is having generalized pain that is increased by raising the leg. The Official Disability Guidelines (ODG) state that for uncomplicated low back pain with radiculopathy MRI is not recommended until after at least one month of conservative therapy and sooner if severe or progressive neurologic deficit is present. The ODG also states that repeat MRI should not be routinely recommended, and should only be reserved for significant changes in symptoms and/or findings suggestive of significant pathology. The worker in this case, the provider referred the worker for a spinal surgery consultation with a plan to have a lumbar MRI prior to this consultation. However, there were insufficient documented signs or symptoms to justify this request. There were insufficient physical findings to suggest a red flag diagnosis or worsening from prior reports. Therefore, MRI of the lumbar spine will be considered medically unnecessary until criteria are met.
