HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: New Jersey, Michigan, California
 Certification(s)/Specialty: Neurology, Neuromuscular Medicine

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 56 year old male with an industrial injury dated December 30, 2013. The injured worker diagnoses include L4-5 and L5-S1 disc herniation and left L5 radiculopathy. He has been treated with diagnostic studies, prescribed medications and periodic follow up visits. According to the progress note dated 2/13/2015, the injured worker reported pain from hip to left foot. The treating physician prescribed Translaminar Epidural Steroid Injection at L5/S1 levels.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Translaminar Epidural Steroid Injection at L5/S1 levels: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Epidural Steroid Injections Page(s): 46.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 309.

Decision rationale: According to MTUS guidelines, epidural steroid injection is optional for radicular pain to avoid surgery. It may offer short term benefit; however there is no significant long term benefit or reduction for the need of surgery. There is no evidence that the patient has

been unresponsive to conservative treatments. In addition, there is no recent clinical and objective documentation of radiculopathy including EMG/NCV findings. MTUS guidelines do not recommend epidural injections for back pain without radiculopathy. Therefore, the request for Translaminar Epidural Steroid Injection at L5/S1 levels is not medically necessary.
