HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: California, Indiana, Oregon
 Certification(s)/Specialty: Orthopedic Surgery

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 67-year-old male, who sustained an industrial injury on 2/21/13. The injured worker has complaints of low back pain. The diagnoses have included lumbar disc protrusion with facet hypertrophy and knee tendinosis. Treatment to date has included epidural injections and magnetic resonance imaging (MRI) of the right knee and X-rays. The request was for right knee arthroscopy.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Right knee arthroscopy: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) knee.

Decision rationale: CA MTUS/ACOEM Chapter 13 Knee Complaints, pages 344-345, states regarding meniscus tears, "Arthroscopic partial meniscectomy usually has a high success rate for cases in which there is clear evidence of a meniscus tear" symptoms other than simply pain

(locking, popping, giving way, recurrent effusion). According to ODG Knee and Leg section, Meniscectomy section, states indications for arthroscopy and meniscectomy include attempt at physical therapy and subjective clinical findings, which correlate with objective examination and MRI. In this case the exam notes from 11/13/14 do not demonstrate evidence of a surgical lesion on the MRI. Therefore the request is not medically necessary.
