HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: California

Certification(s)/Specialty: Physical Medicine & Rehabilitation, Pain Management

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 62 year old female, who sustained an industrial injury on 4/08/2003. The medical records submitted for this review did not include the details regarding the initial injury or the prior treatments to date. Diagnoses include chronic low back and bilateral lower extremity pain, lumbar protrusion; status post cervical fusion, chronic left shoulder pain, cervical radiculopathy, and a history of hepatitis C. Currently, she complained of ongoing neck pain with radiation into the arms. On 2/26/15, the physical examination documented no acute changes. The plan of care included Tylenol No. 3, #60 and Valium 5mg #60.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Retrospective Tylenol No. 3 quantity 60: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids Page(s): 79,80,81.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines 8 C.C.R. 9792.20 - 9792.26 MTUS (Effective July 18, 2009) Page(s): 44, 47, 75-79, 120 of 127.

Decision rationale: Regarding the request for Tylenol #3, California Pain Medical Treatment Guidelines state that this is an opiate pain medication. Due to high abuse potential, close follow-up is recommended with documentation of analgesic effect, objective functional improvement, side effects, and discussion regarding any aberrant use. Guidelines go on to recommend discontinuing opioids if there is no documentation of improved function and pain. Within the documentation available for review, there is no indication that the medication is improving the patient's function or pain (in terms of specific examples of functional improvement and percent reduction in pain or reduced NRS) and no discussion regarding aberrant use. As such, there is no clear indication for ongoing use of the medication. Opioids should not be abruptly discontinued, but unfortunately, there is no provision to modify the current request to allow tapering. In light of the above issues, the currently requested Tylenol #3 is not medically necessary.

Retrospective Valium 5mg quantity 60: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Benzodiazepines Page(s): 24.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines x 8 C.C.R. 9792.20 - 9792.26 MTUS (Effective July 18, 2009) Page(s): 24 of 127.

Decision rationale: Regarding the request for Valium (diazepam), Chronic Pain Medical Treatment Guidelines state the benzodiazepines are "Not recommended for long-term use because long-term efficacy is unproven and there is a risk of dependence. Most guidelines limit use to 4 weeks. Tolerance to anxiolytic effects occurs within months and long-term use may actually increase anxiety. A more appropriate treatment for anxiety disorder is an antidepressant." Within the documentation available for review, there is no documentation identifying any objective functional improvement as a result of the use of the medication and no rationale provided for long-term use of the medication despite the CA MTUS recommendation against long-term use. Benzodiazepines should not be abruptly discontinued, but unfortunately, there is no provision to modify the current request to allow tapering. In the absence of such documentation, the currently requested Valium (diazepam) is not medically necessary.
