Wildfire Smoke Air Pollution: Health Hazards & Advice

What is known & not known
What can we do in planning & responding

Pre-Fire Season Briefing, 4/15/2019

Dr. Bob Bernstein, MD, PhD, MPH
Tuolumne County Health Officer
RBernstein@co.Tuolumne.ca.us
Wildfire Smoke Air Pollution: Health Hazards & Advice

What is known about exposures to respirable-size air pollution in emergency* situations?

* There is an important distinction between the health hazards that can be caused by unprotected, short-term, emergency/natural-disaster-related, and therefore unpreventable air pollution episodes/exposures, compared to the consequences of long-term, unprotected exposures to preventable/mitigateable man-made air pollution (e.g., compare slide 12 and the last slide).

Pre-Fire Season Briefing, 4/15/2019

Dr. Bob Bernstein, MD, PhD, MPH
Tuolumne County Health Officer
RBernstein@co.Tuolumne.ca.us
Relevance of the Explosive Eruption of Mt. St. Helens Volcano 18 May 1980

Examples

- Mono-Inyo Craters past 5,000 years
- Mount St. Helens May 18, 1980 (~1 km³)
- Pinatubo, 1991 (~10 km³)
- Tambora, 1815 (> 100 km³)
- Yellowstone Caldera 600,000 years ago (~1,000 km³, not depicted)
Volcanic Ash: An unpreventable episode of air pollution – what a mess: How hazardous? Who is most at risk? Prevention?
MSH Volcanic Ash — was it a lung hazard, for whom?

* Depends on the size, shape, toxicity, airborne concentration, and duration of exposure — and whether exposures are controlled.
Ashfalls & Respiratory Effects of Mt. St. Helens’ Eruptions and locations of Washington and Oregon hospitals participating in ER surveillance, 18 May – 12 June 1980*

The Value of Surveillance: Emergency Room (ER) Visits for Respiratory Problems*

Loggers at increased risk of high ash exposure*

Presidential and FEMA Response to Mt St Helens
Results of a 4-Year Study of Volcanic Ash-Exposed Loggers*

Lessons Learned – Applicable to Wildfire Smoke*

• Have standard methods of measuring air pollution levels and potential human exposures available, agreeable, and visible to all agencies, and ensure that they are rehearsed during quiescent times (at least once per year)

• Have redundancy in the air pollution measurement system to avoid swamping a few agencies/people with analyses (consider whether methods can be run at commercial labs)

• Have pre-prepared consistent messages on communicating locations, levels, and changes in air pollution ready to roll out that can be updated with real time information and evidence-based, action-oriented health and safety advisories as needed for responders, for healthcare facilities, and for the general public and vulnerable groups

• Consider the consequences of your air quality/water quality testing: what will your advice be for different scenarios? You don’t want to be developing these advisories in real time.
  • What will you advise responding agency personnel and the public to do if you find that a high proportion of the smoke particulates are highly respirable in size (<2.5 to 10 microns), or have hazardous levels of chemical contaminants? Be honest about what you know, what you don’t know, what you’re doing about it, what best practices you can advise for responders (e.g., apply fit-testing and use N95 respirators) and the public (see CDC & EPA Guides in following slides), and on what time frame your advice may change....

• Use a NIMS-compliant Unified Incident Command approach to Emergency Management and include the logos of all responding agencies on public messaging (see: https://www.nrt.org/sites/2/files/ICSUCTA.pdf and https://www.caloes.ca.gov/PlanningPreparednessSite/Documents/01%20SEMS%20Maint%20Brochure%20May_2014.pdf)

* Planning and responding agencies with authorities and interests could include County agencies (OES, HSA, LE, CRA), Tribal agencies, State & Regional agencies (CalOES, CalEPA, CalFire, CHP, CDPH), Federal agencies (USEPA, USDoI/FS, CDC), etc...
Critical Review of Health Impacts of Wildfire Smoke Exposure*

Background: Wildfire activity is predicted to increase in many parts of the world due to changes in temperature and precipitation patterns from global climate change. Wildfire smoke contains numerous hazardous air pollutants and many studies have documented population health effects from this exposure.

Objectives: We aimed to assess the evidence of health effects from exposure to wildfire smoke and to identify susceptible populations.

Methods: We reviewed the scientific literature for studies of wildfire smoke exposure on mortality and on respiratory, cardiovascular, mental, and perinatal health. Within those reviewed papers deemed to have minimal risk of bias, we assessed the coherence and consistency of findings.

Discussion: Consistent evidence documents associations between wildfire smoke exposure and general respiratory health effects, specifically exacerbations of asthma and chronic obstructive pulmonary disease (COPD). Growing evidence suggests associations with increased risk of respiratory infections and all-cause mortality. Evidence for cardiovascular effects is mixed, but a few recent studies have reported associations for specific cardiovascular end points. Insufficient research exists to identify specific population subgroups that are more susceptible to wildfire smoke exposure.

Conclusions: Consistent evidence from a large number of studies indicates that wildfire smoke exposure is associated with respiratory morbidity with growing evidence supporting an association with all-cause mortality. More research is needed to clarify which causes of mortality may be associated with wildfire smoke, whether cardiovascular outcomes are associated with wildfire smoke, and if certain populations are more susceptible.

WILDFIRE POLLUTION HARMs HEALTH

Fine particle (PM$_{2.5}$) effects

- Asthma attacks, breathing problems
- Eye, lung, throat irritation
- Heart disease effects worsened
- Premature death
Bay Area Wildfire Scenes & Health Messages

- Keep children indoors and limit their activity
- Everyone stay indoors, windows & doors closed
- Utilize a “clean” room if available
- Limit outdoor activities
- No outdoor exercising
- If necessary, find a clean air space:
  - local library
  - shopping mall
  - theater
Wildfire Smoke Air Pollution: Health Hazards & Advice

What can we do in planning & responding

Pre-Fire Season Briefing, 4/15/2019

Dr. Bob Bernstein, MD, PhD, MPH
Tuolumne County Health Officer
RBernstein@co.Tuolumne.ca.us
Be Ready! Wildfires

Windows/Vents
Close all windows, doors, vents, blinds before evacuating.

Smoke Detector
Install a dual-sensor smoke alarm on each level of your home. Test monthly and change the batteries at least once each year.

Flame/Smoke
Smoke from wildfires is a mixture of gases and fine particles. Smoke can hurt your eyes, irritate your respiratory system, and worsen chronic heart and lung diseases. Listen and watch for air quality reports and health warnings about smoke. You can suffer from smoke even if you are not in the direct path of the wildfire.

Radio
Stay tuned to local radio or television station for information and instructions from local officials.

Escape Route
Have several planned escape routes away from your home—by car or on foot.

Firewood
Stack firewood away from house.

Vegetation
Clean gutters, rake leaves, and remove dead limbs from around your home.

Water
If there is the threat of a wildfire, you can use your hose or sprinkler to wet your roof and shrubs around your home.

Go-Kit
Have a disaster supply kit ready to take with you.

Wildfire Smoke: Guide for Public Health Officials

- Air quality and health information updated 2016
- Evidenced-based exposure reduction measures
- Entirely new section on communicating air quality
  - Uses “Current PM” levels from AirNow
  - Uses satellite information on Fires: Current Conditions page
  - Visual range information updated
  - New interagency Wildland Fire Air Quality Response Program
- Used by the states which provided recommendations for improvements

https://www3.epa.gov/airnow/wildfire_may2016.pdf
Protecting Children from Wildfire Smoke and Ash

Background
- Children are especially at risk for health effects from exposure to wildfire smoke and ash, mostly because their lungs are still growing.
- Wildfire concerns include the fire itself, the smoke and ash, and the chemicals from materials that have burned, such as furniture.
- Smoke can travel hundreds of miles from the source of a fire. Pay attention to local air quality reports during fire season, even if no fire is nearby.
- Create a “clean room” in your home. Choose a room with few windows and doors. Buy a portable air cleaner you can use in this room. Never use an ozone-generating air cleaner.

Health Effects from Wildfire Smoke and Ash
- Children who breathe in wildfire smoke and ash can have chest pain and tightness; trouble breathing; wheezing; coughing; nose, throat, and eye burning; dizziness; or other symptoms.
- Children with asthma, allergies, or chronic health issues may have more trouble breathing when smoke or ash is present.
- Stock up on food, medicine and child care supplies before the threat of a wildfire.
- Remember that you may need to leave your home. Plan for it and prepare your children.

During Wildfires
- Continue to listen to local reports and public health warnings.
- Keep children indoors with the doors and windows closed. Use your “clean room”. If you have an air conditioner, run it with the fresh-air intake closed to keep outdoor smoke from getting indoors. Use your portable air cleaner as well. Reduce health risks by avoiding strenuous activities.
- Keep the indoor air as clean as possible. Do not smoke. Do not use gas, propane, or wood-burning stoves, fireplaces, or candles. Never use ozone-generating air cleaners. Never use natural gas or gasoline-powered generators indoors. Do not use spray cans. Do not fry or broil meat. Do not vacuum. All of these can lead to poor air quality.

Preparing for Wildfires
- Pay attention to local air quality reports. Stay alert to smoke-related news coverage and public health advisories.
- Look up your local Air Quality Index (AQI) on the AirNow (www.airnow.gov) website.
- If EnviroFlash is available for your area, sign up for air quality alerts. (http://www.enviroflash.info/).
**Special considerations:**

- If your child has any problem breathing, is very sleepy, refuses food and water, or other health concerns, reduce his/her exposure to smoke and seek medical help right away.
- If your child has asthma, allergies, or a chronic health condition, he/she is at high risk from health effects related to wildfire smoke and ash. Seek medical advice as needed. For children with asthma, follow the asthma action plan.
- Do not rely on masks for protection from smoke. Paint, dust, and surgical masks are not made to fit children and will not protect children from breathing wildfire smoke. Humidifiers or breathing through a wet washcloth do not prevent breathing in smoke.

**Evacuation**

- Seek shelter in another place (e.g., public air shelter) if your family does not have an air conditioner OR air cleaner OR it is too warm in your home to stay inside with the windows closed. Plan to take the quickest route to the shelter to limit exposure to smoke.
- Bring all medication (taken by each family member) with you.
- Reduce smoke in your vehicle by closing the windows and vents and operating the air conditioning with the fresh intake closed to keep outdoor smoke from getting into car. Never leave children in a car or truck alone.

**After a Wildfire**

- Make sure ash and debris have been removed before bringing your child back to home or school.
- Children should not be doing any cleanup work. Fires may deposit large amounts of ash and dust with harmful chemicals. Avoid bringing polluted ash and dust back to areas used by children (such as a home or car). Remove shoes at the doorway, wash clothing separately, and change out of clothing before you have contact with your children.

**For more information:**

- Get air quality information: Check the [airnow.gov](https://airnow.gov) website, or your state air quality agency’s website.
- Air Quality Flag Program: This visual tool alerts schools and organizations and their communities to the local air quality forecast. [https://airnow.gov/flag](https://airnow.gov/flag)
- Find certified air cleaning devices: [http://www.arb.ca.gov/research/indoor/aircleaners/certified.htm](http://www.arb.ca.gov/research/indoor/aircleaners/certified.htm)
- Contact Poison Control at 1-800-222-1222 for emergency concerns regarding ingestion or exposure to hazards.
- Contact your Pediatric Environmental Health Specialty Unit with children’s environmental health questions: [www.pehsu.net](http://www.pehsu.net)
**Immediate Release: Tuolumne County Air Quality Health Alert**

SONORA—Fires, including those outside of Tuolumne County, are affecting air quality in many areas in Tuolumne County. Smoke accumulation has rendered air quality unhealthy for sensitive groups in some areas and unhealthy to very unhealthy in other areas for everyone (see chart below).

The following information is provided to allow you to assess the air quality in your immediate vicinity and to provide guidance for those people who live in neighborhoods affected by poor air quality.

Because the Tuolumne County geography may trap smoke in certain valleys and basins, the following visibility chart can be used to determine the air quality where you are. Visibility provides an excellent measure of air quality.

First identify on a map certain landmarks on the horizon. Then check to see at what distance the landmarks can no longer be seen. The distance of this landmark is the “visibility in miles.”

<table>
<thead>
<tr>
<th>Air Quality Index Levels of Health Concern</th>
<th>Visibility in Miles</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| Good| Unlimited| Air quality is considered healthy for all groups of people.
| Moderate| 6-0 miles| Air quality is acceptable. However, for some pollutants there may be a moderate health concern for a very small number of people who are unusually sensitive to air pollution.
| Unhealthy for sensitive groups| 3-0 miles| Members of sensitive groups may experience health effects. The general public is not likely to be affected.
| Unhealthy| 1.5-2.5 miles| Everyone may begin to experience health effects. Members of sensitive groups may experience more serious health effects.
| Very unhealthy| 0.1-0.5 miles| Health alert; everyone may experience more serious health effects.
| Hazardous| 0.79 mile or less| Health warnings of emergency conditions. The entire population is more likely to be affected.

The following guidelines can help to prevent breathing problems during times when air quality is poor due to wildfires:

1. Individuals with long-term health conditions like asthma, lung or heart disease should make sure that they have a supply of medications on hand and are following their caregivers’ instructions.
2. Elderly and very young children should limit their outdoor activities when local air quality is “unhealthy for sensitive groups” (visibility less than 5 miles).
3. Signs that the smoke may be bothering you include coughing, scratchy throat, irritated sinuses, shortness of breath, stinging eyes or runny nose. Sometimes symptoms may even include chest pain or headaches. Consult your caregiver for worsening symptoms.
4. If you are advised to stay indoors, keep indoor air as clean as possible. Keep windows and doors closed unless it is extremely hot outside. Run an air conditioner if you have one, but keep the fresh-air intake closed and the filter clean to prevent outdoor smoke from getting inside. If you do not have an air conditioner and it is too warm to stay inside with the windows closed, seek shelter elsewhere.
5. Consider a high-efficiency particulate air (HEPA) filter to reduce breathing problems. Room air cleaners, which utilize a HEPA filter, may reduce the number of irritating fine particles in indoor air.
6. Do not add to indoor pollution. Do not smoke because smoking puts even more pollution into the air.

The Tuolumne County Air Pollution Control District will continue to monitor air quality and will provide updates with the Public Health Department as the information becomes available.

Examples of County Health Department Advisories: Tuolumne County
As fire agencies battle wildfires, there are measures we all can take to protect our health from harmful pollutants in our air. Smoke is a respiratory irritant that can worsen conditions such as asthma, other chronic lung conditions, or heart disease. Pregnant women, children, elderly people, smokers, and people who work or exercise outdoors are at higher risk for complications from smoke exposure.

Here are some tips you can follow to protect you and your family members from unhealthy air:

**Stay indoors.** Remain indoors, with air conditioning on, as much as possible when air pollution levels are unhealthy. Check the local Air Quality Index (AQI) for this information. Keep the air conditioner filter clean to prevent bringing additional smoke inside. In extremely hot weather, staying inside with the windows closed, without air conditioning may be dangerous. A swamp cooler will not provide protection and will pull in the smoky air from outside. Consider seeking alternative shelters in this situation.

**Reduce outdoor activity.** If it looks smoky outside, it is not a good time for outdoors exercise and activity for people of any age. People with heart or lung disease should take further measures to avoid prolonged exertion and outdoor exposure. Reducing you physical activity outdoors lowers the amount of unhealthy air your body takes in.

**Consult your physician.** If you or a family member have heart or lung disease, if you are an older adult, or if you have children, talk with your doctor about whether and when you should leave the area. When smoke is heavy for a prolonged period of time, fine particles can build up indoors, even though you may not be able to see them. If you have asthma or other lung disease, call your doctor if your symptoms worsen.

**Have a plan.** Be sure to have a family emergency plan and kit with an adequate supply of food, water, medications, and necessities for at least 72 hours in the event that you need to stay home or evacuate.

**Keep informed.** Visit the local Air Quality Index website (see below) for updates on the air quality and air smoke monitoring. Register for emergency alert texts and emails with the Mariposa County Sheriff.

**Use of Respirators - not “Masks.”** Masks, such as dust, surgical masks or wet bandanas, will not protect your lungs. If the smoke is that irritating to you, the best option is to remain indoors or temporarily relocate. An option is a NIOSH approved disposable respirator, such as an N95. These can be beneficial to reduce particulate inhalation. People with heart or lung conditions should consult their doctor before using a respirator.

**Take a break.** If you can, take a break by traveling to a smoke-free area away from the wildfire, even if it is just for 3–4 hours. This can be helpful for both your physical health, and a relief from other stressors.

**More Resources:**

Mariposa County Air Quality Index Website:
https://www.mariposacounty.org/Index.aspx?ID=1434

AirNow Website “How Smoke from Fires Can Affect Your Health”
https://www.airnow.gov/index.cfm?action=smoke.index
The California wildfires in Butte, Los Angeles and Ventura counties destroyed thousands of homes, structures and medical practices, as well as displaced thousands of Californians.

Payors are taking action to ensure physicians can continue to render care to their patients.

CMA compiled this guide to help physicians navigate the services offered by each payor.

Public Health Approach:
= Surveillance & Response

Surveillance: What, where & among whom is the problem?

Risk Factor Investigation: What is the cause?

Evaluation: What worked & what did not work?

Response: Improve prevention & control efforts

Establish preventive & control programs – then, monitor & continuously improve the performance, quality & results of prevention & control efforts
Background: Experimental and epidemiological studies indicate a relationship between long-term exposure to particulate matter air pollution and increased risk for type 2 diabetes. Given the high and increasing prevalence of diabetes, we quantified the burden of diabetes attributable to long-term particulate matter exposures originating from ambient and household air pollution.

Findings: Approximately one-fourth of the global burden of diabetes was attributed to long-term exposure to PM2.5, with an estimated 276 thousand (95% uncertainty interval (UI): 186–340 thousand) deaths and 15.2 thousand (10.0–19.9 thousand) disability-adjusted life-years (DALYs) in 2017.

Interpretation: Long-term exposure to air pollution constitutes a major risk factor for diabetes, with a larger attributable burden than tobacco or physical inactivity. Air pollution mitigation therefore may have an important role in reducing the global disease burden from diabetes.
