Introduction

Nausea and vomiting are common complications of anesthesia. Other sources of nausea include:

- Visceral pain,
- Severe headaches,
- Traumatic brain injury,
- Eye pain,
- Heart attack,
- Infections,
- Food poisoning,
- Adverse effects of medications,
- Motion sickness,
- Severe anxiety, and
- Severe pain.

A wide variety of antiemetic agents are administered by various routes to prevent and treat perioperative and other nausea and vomiting [1-9], including:

- Serotonin receptor antagonists (5HT3 and H1) [7],
- Dopamine receptor antagonists,
- Substance P antagonists [10],
- Antihistamines, and

Uncommonly used agents have included:

- Dexamethasone [12],
- Anticonvulsants [13-20],
- Dimenhydrinate [5], and
- Neurokinin-1 receptor antagonists [21].

The specific antiemetic agents most commonly used are reportedly:

- Droperidol,
- Metoclopramide [2], and
- Ondansetron [9].

Some prior systematic reviews have suggested no clear superiority of any single antiemetic [8, 14].
Treatment Recommendation

Antiemetics
Recommended.

Antiemetics are moderately recommended for peri-operative nausea and vomiting and in cases of severe pain causing nausea and vomiting.

*Strength of Evidence* – Moderately Recommended, Evidence (B)

*Level of Confidence* – High

**Indications:**
Pre-, peri- and post-operative nausea and emesis. Often used prophylactically either pre-operatively or at the end of the operative procedure when emesis is potentially anticipated and/or has significant impacts on the type of surgical procedure/wound. Also, may be provided post-operatively where there is ongoing nausea and/or vomiting either present or anticipated to potentially occur. In infrequent cases, severe pain without surgery may be associated with nausea and warrant treatment.

**Benefits:**
Reduced, prevented, or resolved nausea and vomiting

**Harms:**
Adverse effects vary based on type of medication. Common adverse effects include drowsiness, dry mouth, urinary retention, blurred vision, sedation, tremor.

**Frequency/Dose/Duration:**
Per manufacturer recommendation. Most studies administered intravenous (I.V.) medication at close of surgery with some studies administering medication immediately pre-operatively. Routes used besides I.V. have included oral, PCA pump, and intramuscular. The rectal route is used typically as a tertiary strategy after common routes and/or combinations of medications have failed, although supportive quality studies were not found for rectal (PR) administration. Medications and doses used in quality studies include (most given I.V.):

- a. Aprepitant 40, 80, 125mg and 40mg P.O.
- b. Cyclizine 50mg
- c. Dimenhydrinate 50mg and 1mg/kg
- d. Dolasetron mesylate 12.5, 25, 50, 100 mg
- e. Droperidol 0.625, 1.25, 2.5, 5, 10, 15, 50mg and 0.014 micrograms/kg
- f. Granisetron 0.1, 1, 3mg and 20, 40 micrograms/kg
- g. Metoclopramide 10,20mg and 0.25mg/kg and 10mg P.O.
- h. Ondansetron 1, 2, 4, 8mg and 100 micrograms/kg and 4, 8mg P.O.
- i. Palonosetron 0.025, 0.05, 0.075mg
- j. Perphenazine 5mg
- k. Prochlorperazine 0.1,10mg
- l. Ramosetron 0.15, 0.3, 0.6mg and 4 micrograms/kg and 0.1mg P.O.
- m. Rolapitant 20, 70, 200mg
- n. Tropisetron 2.5mg and 0.1mg/kg
Various combinations of agents have been used and generally suggest superiority of multiple agents over single agent approaches, thus providing potential tertiary treatment strategies for more difficult cases. Quality evidence supports combinations including Dolasetron and Droperidol; Droperidol and Ondansetron, and Dimenhydrinate and Droperidol [2].

**Indications for Discontinuation:** Resolution of symptoms

**Rationale:**
There are multiple anti-emetic agents with demonstrated efficacy, although not all studies report efficacy. Anti-emetic agents are either non-invasive or minimally invasive depending on administration route, have low adverse effects, are mostly low cost, have demonstrated efficacy and are thus recommended.

**Evidence:**
A comprehensive literature search was conducted using PubMed, Scopus, CINAHL, Cochrane Library, and Google Scholar without date limits using the following terms: Antiemetics, Antiemetic Agents; Hip Osteoarthritis, Hip Degenerative Joint Disease, Hip Osteoarthrosis, Hip Degenerative Arthritis; controlled clinical trial, controlled trials, randomized controlled trial, randomized controlled trials, random allocation, random*, randomized, randomization, randomly; systematic, systematic review, retrospective, and prospective studies. We found and reviewed 1119 articles in PubMed, 279 in Scopus, 38 in CINAHL, 38 in Cochrane Library, 497 in Google Scholar (Went through first 100), and 50 from other sources. We considered for inclusion 36 from PubMed, 0 from Scopus, 0 from CINAHL, 0 from Cochrane Library, 0 from Google Scholar, and 83 from other sources. Of the 119 articles considered for inclusion, 86 were randomized controlled trials and 33 systematics reviews.

**Guideline/Condition Applicability**

**Ankle and Foot Disorders**
- Achilles Bursitis or Tendinopathy
- Achilles Tendon Rupture
- Bunion
- Charcot Arthropathy
- Chronic Ulcer, Lower Limb (Including Toes, Foot, Ankle, Calf)
- Fracture, Ankle
- Fracture, Calcaneus
- Fracture, Forefoot (Sesamoid, Phalanges)
- Fracture, Metatarsal Bones
- Fracture, Midfoot (Cuboid, Cuneiform, Navicular)
- Fracture, Talus
- Fracture, Tibia or Fibula
- Hammertoe
- Morton Neuroma
- Paronychia
