Decision Date:	03/17/2014	UR Denial Date:	11/26/2013
Priority:	Standard	Application Received:	12/06/2013

HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to a physician reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The physician reviewer is Board Certified in Orthopedic Surgery and is licensed to practice in California. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The physician reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

According to the records made available for review, this is a 56-year-old male with a 12/4/12 date of injury. At the time of request for authorization for right elbow platelet rich plasma injection with ultrasound guidance, there is documentation of subjective improved right elbow pain and objective moderate lateral epicondylitis tenderness findings. The current diagnoses are right lateral epicondylitis and right elbow distal biceps strain. The treatment to date includes physical therapy and medications.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Platelet rich plasma injection with ultrasound guidance, right elbow: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 10 Elbow Disorders (Revised 2007) Page(s): 24.

Decision rationale: The California MTUS reference to ACOEM guidelines state that there are no quality studies of platelet-rich plasma (PRP) injection in the management of the cited injury/condition and there is no evidence of its benefits. Therefore, based on guidelines and a review of the evidence, the request for Platelet rich plasma injection with ultrasound guidance, right elbow is not medically necessary.
