Date Assigned:	08/01/2014	Date of Injury:	03/01/2009
Decision Date:	09/19/2014	UR Denial Date:	06/26/2014
Priority:	Standard	Application Received:	07/21/2014

HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Anesthesiology, has a subspecialty in Acupuncture and Pain Medicine and is licensed to practice in California. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 58year old female with date of injury of 3/1/09. Her injuries are low back and left knee pain. Per progress report dated 5/27/14, the injured worker complained of low back pain radiating down the left leg to foot with numbness for two weeks. Per physical exam, she had a positive straight leg raise test. Physical therapy was requested. She was treated with injections and medication management. The date of UR decision was 6/26/14.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

MRI Lumbar Spine: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 15 Stress Related Conditions, Chapter 8 Neck and Upper Back Complaints Page(s): 177.

Decision rationale: ACOEM guidelines support ordering of imaging studies for emergence of red flags, physiologic evidence of tissue insult or neurologic dysfunction, failure to progress in a strengthening program intended to avoid surgery, and clarification of the anatomy prior to an invasive procedure. Physiologic evidence may be in the form of definitive neurologic findings on physical examination, electrodiagnostic studies, laboratory tests, or bone scans. Unequivocal

findings that identify specific nerve compromise on the neurologic examination are sufficient evidence to warrant imaging studies if symptoms persist. When the neurologic examination is less clear, however, further physiologic evidence of nerve dysfunction can be obtained before ordering an imaging study. Electromyography (EMG), and nerve conduction velocities (NCV), including H-reflex tests, may help identify subtle focal neurologic dysfunction in patients with neck or arm symptoms, or both, lasting more than three or four weeks. In the absence of any red flags, the California MTUS and ACOEM guidelines do not support lumbar spine imaging prior to failure of a course of conservative treatment. At the time of request, the injured worker had not had physical therapy and they had no clinical findings of weakness. The request is not medically necessary.
