HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. The expert reviewer is Board Certified in Family Medicine and is licensed to practice in California. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/services. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

This is a 52-year-old male patient who reported an industrial injury on 11/28/2012, almost 2 years ago, attributed to the performance of his usual and customary job tasks reported as running into a large stack of foam bags with his forklift. The patient complained of pain to the left ankle and left knee along with low back pain. The patient has been diagnosed with a left inguinal strain due to lifting. There was no indication for surgical intervention or hernia repair. The treatment plan included anti-inflammatories and pain medications. The patient was also diagnosed with left knee pain and left ankle pain. The patient was prescribed a topical compounded KG L cream 240g.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Topical KGL Cream 240GM: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Topical Analgesics.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 3 Initial Approaches to Treatment Page(s): 128, Chronic Pain Treatment Guidelines anti-inflammatory medications topical analgesics Page(s): pages 22, 67-68; pages 111-113.

Decision rationale: The prescription for compounded topical KGL cream 240 grams is not medically necessary for the treatment of the patient for pain relief for the orthopedic diagnoses of the patient. There is no clinical documentation submitted to demonstrate the use of the topical gels for appropriate diagnoses or for the recommended limited periods of time. It is not clear that the topical compounded medications are medically necessary in addition to prescribed oral medications. There is no provided subjective/objective evidence that the patient has failed or not responded to other conventional and recommended forms of treatment for relief of the effects of the industrial injury. Only if the subjective/objective findings are consistent with the recommendations of the ODG, then topical use of topical preparations is only recommended for short-term use for specific orthopedic diagnoses. There is no provided rationale supported with objective evidence to support the prescription of the topical compounded cream. There is no documented efficacy of the prescribed topical compounded analgesics with no assessment of functional improvement. The patient is stated to have reduced pain with the topical creams however there is no functional assessment and no quantitative decrease in pain documented. The use of topical NSAIDs is documented to have efficacy for only 2-4 weeks subsequent to injury and thereafter is not demonstrated to be as effective as oral NSAIDs. There is less ability to control serum levels and dosing with the topicals. The patient is not demonstrated to have any GI issue at all with NSAIDs. There is no demonstrated medical necessity for topical NSAIDs for chronic pain for a prolonged period of time. The request for the topical NSAID KGL cream 240 grams is not medically necessary for the treatment of the patient for the diagnosis of the chronic pain. The use of the topical gels/creams does not provide the appropriate therapeutic serum levels of medications due to the inaccurate dosing performed by rubbing variable amounts of gels on areas that are not precise. The volume applied and the times per day that the gels are applied are variable and do not provide consistent serum levels consistent with effective treatment. There is no medical necessity for the addition of gels to the oral medications in the same drug classes. There is no demonstrated evidence that the topicals are more effective than generic oral medications. The use of compounded topical KGL cream 240 grams is not supported by the applicable evidence based guidelines as cited above. The continued use of topical NSAIDs for the current clinical conditions is not otherwise warranted or demonstrated to be appropriate. There is no documented objective evidence that the patient requires both the oral medications and the topical analgesic medication for the treatment of the industrial injury. The prescription for compounded topical KGL cream 240 grams is not medically necessary for the treatment of chronic pain. This request is not medically necessary.
