HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: North Carolina
 Certification(s)/Specialty: Family Practice

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 49 year old female, who sustained an industrial injury on 10-25-2000. The mechanism of injury was cumulative trauma. The injured worker was diagnosed as having carpal tunnel syndrome, lumbar sprain and myalgia-myositis. There is no record of a recent diagnostic study. Treatment to date has included cervical and lumbar fusions, chiropractic care, epidural steroid injection, therapy and medication management. In progress notes dated 12-29-2014 and 2-30-2014, the injured worker complains of low back pain. The treating physician is requesting 6 sessions of chiropractic care for the neck, low back and wrists and functional capacity evaluation for the neck, low back and wrists.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Chiropractic, Neck, Low Back, Wrists, 6 sessions: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Manipulation Page(s): 58.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines manual manipulation Page(s): 58-59.

Decision rationale: The California chronic pain medical guidelines section on manual manipulation states: Recommended for chronic pain if caused by musculoskeletal conditions. Manual Therapy is widely used in the treatment of musculoskeletal pain. The intended goal or effect of Manual Medicine is the achievement of positive symptomatic or objective measurable gains in functional improvement that facilitate progression in the patient's therapeutic exercise program and return to productive activities. Manipulation is manual therapy that moves a joint beyond the physiologic range-of-motion but not beyond the anatomic range-of-motion. Low back: Recommended as an option. Therapeutic care - Trial of 6 visits over 2 weeks, with evidence of objective functional improvement, total of up to 18 visits over 6-8 weeks. Elective/maintenance care - Not medically necessary. Recurrences/flare-ups - Need to reevaluate treatment success, if RTW achieved then 1-2 visits every 4-6 months. Ankle & Foot: Not recommended. Carpal tunnel syndrome: Not recommended. Forearm, Wrist, & Hand: Not recommended. Knee: Not recommended. Treatment Parameters from state guidelines a. Time to produce effect: 4 to 6 treatments. Manual manipulation is recommended form of treatment for chronic pain. However, the requested amount of therapy sessions is in excess of the recommendations per the California MTUS. The California MTUS states there should be not more than 6 visits over 2 weeks and documented evidence of functional improvement before continuation of therapy. Previous chiropractic care has not produced documented significant improvement in pain and function. This does not meet criteria guidelines and thus is not medically necessary.

FCE (functional capacity evaluation) testing, Neck, Low Back, Wrists: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) functional capacity evaluation.

Decision rationale: The California MTUS and the ACOEM do not specifically address functional capacity evaluations. Per the ODG, functional capacity evaluations (FCE) are recommended prior to admission to work hardening programs, with preference for assessments tailored to a specific job. Not recommended as a routine use as part of occupational rehab or screening or generic assessments in which the question is whether someone can do any type of job. Consider FCE 1. Case management is hampered by complex issues such as: a. Prior unsuccessful RTW attempts. b. Conflicting medical reporting on precaution and/or fitness for modified jobs. c. Injuries that require detailed exploration of the worker's abilities. 2. Timing is appropriate. a. Close or at MMI/all key medical reports secure. b. Additional/secondary conditions clarified. There is no indication in the provided documentation of prior failed return to work attempts or conflicting medical reports or injuries that require detailed exploration of the worker's abilities. Therefore, criteria have not been met as set forth by the ODG and the request is not medically necessary.
