HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: California, District of Columbia, Maryland
 Certification(s)/Specialty: Anesthesiology, Pain Management

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

This 28 year old male sustained an industrial injury on 6/12/12. He subsequently reported low back pain. Diagnoses include lumbar internal disc derangement, annular fissure, disc herniation and lumbago. Treatments to date include x-ray and MRI testing, physical therapy and prescription pain medications. The injured worker continues to experience low back pain with radiation to the right lower extremity. Upon examination, there is an antalgic gait. Tenderness to palpation of the paraspinal region at L4 and the iliolumbar region was noted. Painful active range of motion of the lumbar spine was noted. Supine and seated straight leg raising was positive on the right. A request for Norco and random routine urine drug screen was made by the treating physician.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Norco 10/325 mg Qty 150: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids Page(s): 74.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids Page(s): 78, 91.

Decision rationale: Per MTUS Chronic Pain Medical Treatment Guidelines p78 regarding ongoing management of opioids "Four domains have been proposed as most relevant for ongoing monitoring of chronic pain patients on opioids: Pain relief, side effects, physical and psychosocial functioning, and the occurrence of any potentially aberrant (or non-adherent) drug related behaviors. These domains have been summarized as the "4 A's" (Analgesia, activities of daily living, adverse side effects, and any aberrant drug-taking behaviors). The monitoring of these outcomes over time should affect therapeutic decisions and provide a framework for documentation of the clinical use of these controlled drugs." Review of the available medical records reveals no documentation to support the medical necessity of Norco nor any documentation addressing the '4 A's' domains, which is a recommended practice for the on-going management of opioids. Specifically, the notes do not appropriately review and document pain relief, functional status improvement, appropriate medication use, or side effects. The MTUS considers this list of criteria for initiation and continuation of opioids in the context of efficacy required to substantiate medical necessity, and they do not appear to have been addressed by the treating physician in the documentation available for review. It was noted that pain management contract was signed, however, no efforts to rule out aberrant behavior (e.g. CURES report, UDS, opiate agreement) were present in the documentation. As MTUS recommends to discontinue opioids if there is no overall improvement in function, the request is not medically necessary.

Random routine urine drug screen: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids Page(s): 87.

Decision rationale: MTUS Chronic Pain guidelines recommend random drug screening for patients to avoid the misuse of opioids, particularly for those at high risk of abuse. Upon review of the submitted medical records, the injured worker is not a high risk for abuse. Per MTUS CPMTG p87, "Indicators and predictors of possible misuse of controlled substances and/or addiction: 1) Adverse consequences: (a) decreased functioning, (b) Observed intoxication, (c) Negative affective state 2) Impaired control over medication use: (a) Failure to bring in unused medications, (b) Dose escalation without approval of the prescribing doctor, (c) Requests for early prescription refills, (d) Reports of lost or stolen prescriptions, (e) Unscheduled clinic appointments in "distress", (f) Frequent visits to the ED, (g) Family reports of overuse of intoxication 3) Craving and preoccupation: (a) Non-compliance with other treatment modalities, (b) Failure to keep appointments, (c) No interest in rehabilitation, only in symptom control, (d) No relief of pain or improved function with opioid therapy, (e) Overwhelming focus on opiate issues. 4) Adverse behavior: (a) Selling prescription drugs, (b) Forging prescriptions, (c) Stealing drugs, (d) Using prescription drugs in ways other than prescribed (such as injecting oral formulations), (e) Concurrent use of alcohol or other illicit drugs (as detected on urine screens), (f) Obtaining prescription drugs from non-medical sources." Continued opiate therapy is not warranted for the injured worker. Additionally, as the injured worker does not demonstrate any indicators, or is there any documentation of aberrant behavior, the request is not medically necessary.
