HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: California, Oregon, Washington
 Certification(s)/Specialty: Orthopedic Surgery

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 56 year old female who sustained an industrial injury on August 05, 2015. A recent orthopedic follow up dated July 07, 2015 reported the worker being seen for an initial evaluation of bilateral wrist pain. Physical examination noted: a positive Tinel's and Phalen's bilaterally; diminished two-point discrimination and the following diagnoses were applied: bilateral carpal tunnel syndrome; health education and counseling. The plan of care noted administration of injection with "intended carpal tunnel release in the fall." Current medication list showed: alprazolam, Cetirizine, Estradiol, Fluorouracil %5 cream.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Left carpal tunnel release left wrist, outpatient: Upheld

Claims Administrator guideline: Decision based on MTUS Forearm, Wrist, and Hand Complaints 2004. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG), Carpal Tunnel Release.

MAXIMUS guideline: Decision based on MTUS Forearm, Wrist, and Hand Complaints 2004, Section(s): Surgical Considerations.

Decision rationale: Per the CA MTUS/ACOEM guidelines, Chapter 11 Forearm, Wrist and Hand Complaints page 270, Electrodiagnostic testing is required to eval for carpal tunnel and stratify success in carpal tunnel release. In addition, the guidelines recommend splinting and medications as well as a cortisone injection to help facilitate diagnosis. In this case there is lack of evidence in the records of electrodiagnostic evidence of carpal tunnel syndrome. In addition, there is lack of evidence of failed bracing or injections in the records. Therefore the determination is for non-certification. The Official Disability Guidelines were also referenced for more specific recommendations. According to the Official Disability Guidelines regarding surgery for carpal tunnel syndrome, Recommended after an accurate diagnosis of moderate or severe CTS. Surgery is not generally initially indicated for mild CTS unless symptoms persist after conservative treatment. Severe CTS requires all of the following: Muscle atrophy, severe weakness of thenar muscles, 2-point discrimination test greater than 6 mm and positive electrodiagnostic testing. Not severe CTS requires all the following: Symptoms of pain, numbness, paresthesia, impaired dexterity requiring two of the following: Abnormal Katz hand diagram scores, nocturnal symptoms, Flick sign (shaking hand); findings by physical exam, requiring two of the following including compression test, Semmes-Weinstein monofilament test, Phalen's sign, Tinel's sign, decreased 2-point discrimination, mild thenar weakness, (thumb adduction); comorbidities of no current pregnancy; initial conservative treatment requiring three of the following: Activity modification greater than or equal to one month, night wrist splint greater than or equal to one month, nonprescription analgesia (i.e. acetaminophen), home exercise training (provided by physician, healthcare provider or therapist) or successful initial outcome from corticosteroid injection trial (optional) and positive electrodiagnostic testing. In this case there is insufficient evidence of carpal tunnel syndrome and failure of conservative management as stated above. There is insufficient evidence of abnormal hand diagram scores, nocturnal symptoms, decreased two point discrimination or thenar weakness to warrant surgery. Therefore the determination is non-certification, therefore is not medically necessary.
