HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
State(s) of Licensure: California, Arizona, Maryland
Certification(s)/Specialty: Psychiatry

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 29 year old male who sustained an industrial related injury on 9/30/14. Physical examination findings included spasm, tenderness, and guarding in the paravertebral musculature of the cervical spine with loss of range of motion. Decreased sensation was noted bilaterally in the C5 dermatomes with pain. Shoulders showed impingement and Hawkins signs. Diagnoses included cervical radiculopathy, shoulder impingement, and wrist tendonitis/bursitis. Treatment included physical therapy.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Psychotherapy, Qty: 4.00: Overturned

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Page(s): 100-101.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Psychological treatment Page(s): 23, 100-102.

Decision rationale: California MTUS states that behavioral interventions are recommended. The identification and reinforcement of coping skills is often more useful in the treatment of pain

than ongoing medication or therapy, which could lead to psychological or physical dependence. ODG Cognitive Behavioral Therapy (CBT) guidelines for chronic pain recommends screening for patients with risk factors for delayed recovery, including fear avoidance beliefs. Initial therapy for these "at risk" patients should be physical medicine for exercise instruction, using cognitive motivational approach to physical medicine. Consider separate psychotherapy CBT referral after 4 weeks if lack of progress from physical medicine alone: Initial trial of 3-4 psychotherapy visits over 2 weeks, With evidence of objective functional improvement, total of up to 6-10 visits over 5-6 weeks (individual sessions) Upon review of the submitted documentation, it is gathered that the injured worker suffers from chronic pain and could benefit from an initial trial of psychotherapy treatment for chronic pain. Thus, the request for Psychotherapy, Qty: 4.00 is medically necessary.
