HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: California

Certification(s)/Specialty: Physical Medicine & Rehabilitation

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 44 year old female, who sustained an industrial injury on June 8, 2000. The injured worker had reported head, neck and upper and lower extremity pain. The diagnoses have included lumbalgia, spinal stenosis, complex regional pain syndrome upper extremity and cervical radiculopathy. Treatment to date has included medications, radiological studies, intrathecal pump implantation and removal of the intrathecal pump. Current documentation dated February 18, 2015 notes that the injured worker reported ongoing pain rated at a nine-ten out of ten on the visual analogue scale. The injured worker noted low back pain with radiation to the right lower extremity. Physical examination of the lumbar spine revealed tenderness to palpation of the paraspinal muscles and a decreased range of motion. Sensation to light touch was decreased in the right lower extremity lumbar five distribution. A straight leg raise test was noted to be positive. The treating physician's plan of care included a request for twelve sessions of physical therapy to the lumbar spine.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

12 Physical Therapy sessions to the Lumbar Spine, 2 x 6: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Physical Medicine. Decision based on Non-MTUS Citation Official Disability Guidelines, Lumbar Chapter, Physical/Occupational Therapy.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Physical Therapy, pages 98-99.

Decision rationale: Physical therapy is considered medically necessary when the services require the judgment, knowledge, and skills of a qualified physical therapist due to the complexity and sophistication of the therapy and the physical condition of the patient. However, there is no clear measurable evidence of progress with the PT treatment already rendered including milestones of increased ROM, strength, and functional capacity. Review of submitted physician reports show no evidence of functional benefit, unchanged chronic symptom complaints, clinical findings, and functional status. There is no evidence documenting functional baseline with clear goals to be reached and the patient striving to reach those goals. The Chronic Pain Guidelines allow for 9-10 visits of physical therapy with fading of treatment to an independent self-directed home program. It appears the employee has received significant therapy sessions without demonstrated evidence of functional improvement to allow for additional therapy treatments. There is no report of acute flare-up, new injuries, or change in symptom or clinical findings to support for formal PT in a patient that has been instructed on a home exercise program for this chronic injury. Submitted reports have not adequately demonstrated the indication to support further physical therapy when prior treatment rendered has not resulted in any functional benefit. The 12 Physical Therapy sessions to the Lumbar Spine, 2 x 6 is not medically necessary and appropriate.
