HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: California

Certification(s)/Specialty: Physical Medicine & Rehabilitation

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 47-year-old male, who sustained an industrial injury on May 17, 1997. The injured worker was diagnosed as having lumbar radiculopathy, intractable back pain, chronic pain and cauda equine syndrome with neurogenic bladder. Treatment and diagnostic studies to date have included therapy and medication. A progress note dated February 20, 2015 provides the injured worker complains of intractable low back buttock and ankle pain. He reports decreased gastrointestinal (GI) symptoms and stable pain control since medication change. He rates the pain as 4/10 on good days and 8/10 on bad days. Physical exam notes slow gait with limp, lumbar spasm and weakness of right leg. The plan includes home exercise and medication.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Oxycontin 40 mg, ninety count: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids, page(s) 74-96.

Decision rationale: Per the MTUS Guidelines cited, opioid use in the setting of chronic, non-malignant, or neuropathic pain is controversial. Patients on opioids should be routinely monitored for signs of impairment and use of opioids in patients with chronic pain should be reserved for those with improved functional outcomes attributable to their use, in the context of an overall approach to pain management that also includes non-opioid analgesics, adjuvant therapies, psychological support, and active treatments (e.g., exercise). Submitted documents show no evidence that the treating physician is prescribing opioids in accordance to change in pain relief, functional goals with demonstrated improvement in daily activities, decreased in medical utilization or change in functional status. There is no evidence presented of random drug testing or utilization of pain contract to adequately monitor for narcotic safety, efficacy, and compliance. The MTUS provides requirements of the treating physician to assess and document for functional improvement with treatment intervention and maintenance of function that would otherwise deteriorate if not supported. From the submitted reports, there is no demonstrated evidence of specific functional benefit derived from the continuing use of opioids with persistent severe pain for this chronic injury without acute flare, new injury, or progressive deterioration. The Oxycontin 40 mg, ninety count is not medically necessary and appropriate.

Protonix 20 mg, sixty count with one refill: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines NSAIDs, GI Symptoms and Cardiovascular risk, Pages 68-69.

Decision rationale: Protonix medication is for treatment of the problems associated with erosive esophagitis from GERD, or in patients with hypersecretion diseases. Per MTUS Chronic Pain Treatment Guidelines, the patient does not meet criteria for Protonix namely reserved for patients with history of prior GI bleeding, the elderly (over 65 years), diabetics, and chronic cigarette smokers. Submitted reports have not described or provided any GI diagnosis that meets the criteria to indicate medical treatment. Review of the records show no documentation of any history, symptoms, or GI diagnosis to warrant this medication. The Protonix 20 mg, sixty count with one refill is not medically necessary and appropriate.
