HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: California

Certification(s)/Specialty: Physical Medicine & Rehabilitation, Pain Management

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 59-year-old male who sustained an industrial injury on 12/10/10. Initial complaints and diagnoses are not available. Treatments to date include medications. Diagnostic studies are not addressed. Current complaints include pain in the low back. Current diagnostics include lumbago, radiculitis, and disc degeneration. In a progress note dated 02/11/15 the treating provider reports the plan of care as continued medications. The requested treatment is a lumbar epidural steroid injection. A progress report dated February 11, 2015 shows normal sensory and motor findings in the lower extremities.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Lumbar epidural steroid injection: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Epidural steroid injections Page(s): 46.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines 9792.20-9792.26 Page(s): 46 of 127.

Decision rationale: Regarding the request for Lumbar epidural steroid injection, Chronic Pain Medical Treatment Guidelines state that epidural injections are recommended as an option for treatment of radicular pain, defined as pain in dermatomal distribution with corroborative findings of radiculopathy, and failure of conservative treatment. Guidelines recommend that no more than one interlaminar level, or to transforaminal levels, should be injected at one session. Regarding repeat epidural injections, guidelines state that repeat blocks should be based on continued objective documented pain and functional improvement, including at least 50% pain relief with associated reduction of medication use for six to eight weeks, with a general recommendation of no more than 4 blocks per region per year. Within the documentation available for review, there are no recent objective examination findings supporting a diagnosis of radiculopathy. Additionally, there are no imaging or electrodiagnostic studies corroborating the diagnosis of radiculopathy. In the absence of such documentation, the currently requested Lumbar epidural steroid injection is not medically necessary.
