HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:
 State(s) of Licensure: California
 Certification(s)/Specialty: Physical Medicine & Rehabilitation

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a(n) 38 year old female, who sustained an industrial injury on 7/1/05. She reported pain in the neck, wrists, elbows and psyche related to repetitive stress. The injured worker was diagnosed as having depression, lumbar radiculopathy, knee sprain and chronic regional pain syndrome. Treatment to date has included a TENs unit, massage, psychotherapy and pain medications. As of the PR2 dated 2/26/15, the injured worker reports current medications help her get through the day. Since starting to taper her medications her pain level has remained the same, but overall she feels better. The treating physician requested to continue Zohydro 20mg #240 and Lidoderm patches #30.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Zohydroer 20mg quantity requested: 240.00: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Opioids, page(s) 74-96.

Decision rationale: Per the MTUS Guidelines cited, opioid use in the setting of chronic, non-malignant, or neuropathic pain is controversial. Patients on opioids should be routinely monitored for signs of impairment and use of opioids in patients with chronic pain should be reserved for those with improved functional outcomes attributable to their use, in the context of an overall approach to pain management that also includes non-opioid analgesics, adjuvant therapies, psychological support, and active treatments (e.g., exercise). Submitted documents show no evidence that the treating physician is prescribing opioids in accordance to change in pain relief, functional goals with demonstrated improvement in daily activities, decreased in medical utilization or change in functional status. There is no evidence presented of random drug testing or utilization of pain contract to adequately monitor for narcotic safety, efficacy, and compliance. The MTUS provides requirements of the treating physician to assess and document for functional improvement with treatment intervention and maintenance of function that would otherwise deteriorate if not supported. From the submitted reports, there is no demonstrated evidence of specific functional benefit derived from the continuing use of opioids with persistent severe pain for this chronic injury without acute flare, new injury, or progressive deterioration. The Zohydro ER 20mg quantity requested: 240.00 is not medically necessary and appropriate.

Lidoderm patches quantity requested: 30.00: Upheld

Claims Administrator guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Topical Analgesics.

MAXIMUS guideline: Decision based on MTUS Chronic Pain Treatment Guidelines Topical Medications, Pages 111- 113.

Decision rationale: The patient exhibits diffuse tenderness and pain on the exam to the spine and extremities with radiating symptoms. The chance of any type of patch improving generalized symptoms and functionality significantly with such diffuse pain is very unlikely. Topical Lidoderm patch is indicated for post-herpetic neuralgia, according to the manufacturer. There is no evidence in any of the medical records that this patient has a neuropathic source for the diffuse pain. Without documentation of clear localized, peripheral pain to support treatment with Lidoderm along with functional benefit from treatment already rendered, medical necessity has not been established. There is no documentation of intolerance to oral medication as the patient is also on multiple other oral analgesics. The Lidoderm patches quantity requested: 30.00 is not medically necessary and appropriate.
