HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: California

Certification(s)/Specialty: Physical Medicine & Rehabilitation, Pain Management

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 61 year old female, who sustained an industrial injury on 07/22/2011. She reported an injury to her low back. The injured worker is currently diagnosed as having lumbar disc protrusion, lumbar stenosis, and anxiety. Treatment and diagnostics to date has included physical therapy, lumbar spine MRI, lumbar brace, and medications. In a progress note dated 03/16/2015, the injured worker presented with complaints of constant severe sharp, stabbing, throbbing low back pain with numbness, tingling, weakness, and cramping radiating to bilateral legs with muscle spasms. The treating physician reported requesting authorization for acupuncture for the lumbar spine, repeat MRI of the lumbar spine, and electromyography/nerve conduction studies of the bilateral lower extremities.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Acupuncture 2 x 6 for the lumbar spine: Upheld

Claims Administrator guideline: Decision based on MTUS Acupuncture Treatment Guidelines.

MAXIMUS guideline: Decision based on MTUS Acupuncture Treatment Guidelines. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG), Chronic Pain Chapter, Acupuncture.

Decision rationale: Regarding the request for acupuncture, California MTUS does support the use of acupuncture for chronic pain. Acupuncture is recommended to be used as an adjunct to physical rehabilitation and/or surgical intervention to hasten functional recovery. Additional use is supported when there is functional improvement documented, which is defined as "either a clinically significant improvement in activities of daily living or a reduction in work restrictions and a reduction in the dependency on continued medical treatment." A trial of up to 6 sessions is recommended, with up to 24 total sessions supported when there is ongoing evidence of functional improvement. Within the documentation available for review, it is unclear what current concurrent rehabilitative exercises will be used alongside the requested acupuncture. Additionally, the current request for a visit exceeds the 6-visit trial recommended by guidelines. Furthermore, there are no objective treatment goals outlined which are to be addressed with the currently requested acupuncture. Finally, if the patient has had acupuncture previously, there is no documentation of objective functional improvement because of those sessions. As such, the currently requested acupuncture is not medically necessary.

MRI of the lumbar spine: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303-304.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303-304. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG), Low Back Chapter, MRIs (magnetic resonance imaging).

Decision rationale: Regarding the request for repeat lumbar MRI, Occupational Medicine Practice Guidelines state that unequivocal objective findings that identify specific nerve compromise on the neurologic examination are sufficient evidence to warrant imaging in patients who do not respond to treatment and would consider surgery an option. When the neurologic examination is less clear, however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. ODG states that MRIs are recommended for uncomplicated low back pain with radiculopathy after at least one month of conservative therapy. Repeat MRI is not routinely recommended, and should be reserved for a significant change in symptoms and/or findings suggestive of significant pathology. Within the documentation available for review, there is no identification of any objective findings that identify specific nerve compromise on the neurologic exam. Additionally, there is no statement indicating what medical decision-making will be based upon the outcome of the currently requested MRI. Furthermore, there is no documentation indicating how the patient's subjective complaints and objective findings have changed since the time of the most recent MRI of the lumbar spine. In the absence of clarity regarding those issues, the currently requested lumbar MRI is not medically necessary.

EMG/NCV of the bilateral lower extremities: Upheld

Claims Administrator guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303.

MAXIMUS guideline: Decision based on MTUS ACOEM Chapter 12 Low Back Complaints Page(s): 303. Decision based on Non-MTUS Citation Official Disability Guidelines (ODG) Low Back Chapter, Electrodiagnostic Studies.

Decision rationale: Regarding the request for EMG/NCV of the lower extremities, Occupational Medicine Practice Guidelines state that unequivocal objective findings that identify specific nerve compromise on the neurologic exam are sufficient evidence to warrant imaging in patients who do not respond to treatment and who would consider surgery. When a neurologic examination is less clear however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. They go on to state that electromyography may be useful to identify subtle focal neurologic dysfunction in patients with low back symptoms lasting more than 3 to 4 weeks. ODG states that nerve conduction studies are not recommended for back conditions. They go on to state that there is minimal justification for performing nerve conduction studies when a patient is presumed to have symptoms on the basis of radiculopathy. Within the documentation available for review, there are no physical examination findings supporting a diagnosis of specific nerve compromise. Additionally, there is no statement indicating what sort of medical decision-making will be based upon the outcome of the request study. In the absence of clarity regarding those issues, the currently requested EMG/NCV of the lower extremities is not medically necessary.
