HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: Arizona, California

Certification(s)/Specialty: Family Practice

CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 46 year old female who sustained an industrial injury on March 9, 2014. She has reported injury to the low back and leg and has been diagnosed with lumbar radiculopathy and lumbar disc herniations with moderate to severe neural foraminal narrowing. Treatment has included an epidural steroid injection, chiropractic care, physical therapy, acupuncture, and medications. Currently the injured worker complains of constant sharp and aching pain radiating up to her mid back. There was numbness and cramping down bilateral lower extremities to the toes. The treatment request included a weight loss program.

IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

Weight loss program: Upheld

Claims Administrator guideline: The Claims Administrator did not cite any medical evidence for its decision.

MAXIMUS guideline: The Expert Reviewer did not base their decision on the MTUS. Decision based on Non-MTUS Citation Obesity National Guidelines and Agency for Healthcare Quality Research 2010 Feb. p.96.

Decision rationale: According to the guidelines, the initial goal of weight loss therapy is to reduce body weight by approximately 10 percent from baseline. Weight loss at the rate of 1 to 2 lb/week (calorie deficit of 500 to 1,000 kcal/day) commonly occurs for up to 6 months. After 6 months, the rate of weight loss usually declines and weight plateaus because of a lesser energy expenditure at the lower weight. After 6 months of weight loss treatment, efforts to maintain weight loss should be put in place. If more weight loss is needed, another attempt at weight reduction can be made. This will require further adjustment of the diet and physical activity prescriptions. For patients unable to achieve significant weight reduction, prevention of further weight gain is an important goal; such patients may also need to participate in a weight management program. In this case, there is no indication of calorie reduction, exercise or other behavioral interventions. There is no indication of failure or regaining of weight after prior attempts to lose weight. Therefore the request for a weight management program is not medically necessary.
