### HOW THE IMR FINAL DETERMINATION WAS MADE

MAXIMUS Federal Services sent the complete case file to an expert reviewer. He/she has no affiliation with the employer, employee, providers or the claims administrator. He/she has been in active clinical practice for more than five years and is currently working at least 24 hours a week in active practice. The expert reviewer was selected based on his/her clinical experience, education, background, and expertise in the same or similar specialties that evaluate and/or treat the medical condition and disputed items/Service. He/she is familiar with governing laws and regulations, including the strength of evidence hierarchy that applies to Independent Medical Review determinations.

The Expert Reviewer has the following credentials:

State(s) of Licensure: North Carolina

Certification(s)/Specialty: Family Practice

### CLINICAL CASE SUMMARY

The expert reviewer developed the following clinical case summary based on a review of the case file, including all medical records:

The injured worker is a 50 year old male, who sustained an industrial injury on May 30, 2014. He reported low back pain, left shoulder pain and bilateral lower extremity pain. The injured worker was diagnosed as having low back pain, left leg pain, sciatica, shoulder pain, back spasm, rotator cuff tear, lumbar sprain and lumbosacral radiculopathy. Treatment to date has included diagnostic studies, conservative care, medications and work restrictions. Currently, the injured worker complains of continued low back pain, left shoulder pain with left upper extremity numbness and tingling and bilateral lower extremity pain. The injured worker reported an industrial injury in 2014, resulting in the above noted pain. He was treated conservatively without complete resolution of the pain. Evaluation on February 30, 2014, revealed continued pain as noted. Evaluation on March 26, 2015, revealed continued pain. He reported pain medications were not very helpful in reducing pain. He was back to working modified work and was encouraged to continue the home exercise plan. Acupuncture for the lumbar spine and electrodiagnostic studies of the bilateral lower extremities were requested.

### IMR ISSUES, DECISIONS AND RATIONALES

The Final Determination was based on decisions for the disputed items/services set forth below:

**Acupuncture x 8 sessions for the lumbar spine:** Upheld

**Claims Administrator guideline:** Decision based on MTUS Acupuncture Treatment Guidelines.

**MAXIMUS guideline:** Decision based on MTUS Acupuncture Treatment Guidelines.

**Decision rationale:** 1) "Acupuncture" is used as an option when pain medication is reduced or not tolerated, it may be used as an adjunct to physical rehabilitation and/or surgical intervention to hasten functional recovery. It is the insertion and removal of filiform needles to stimulate acupoints (acupuncture points). Needles may be inserted, manipulated, and retained for a period of time. Acupuncture can be used to reduce pain, reduce inflammation, increase blood flow, increase range of motion, decrease the side effect of medication-induced nausea, promote relaxation in an anxious patient, and reduce muscle spasm. Frequency and duration of acupuncture with electrical stimulation may be performed as follows: 1. Time to produce functional improvement 3-6 treatments. 2. Frequency: 1-3 times per week. 3. Optimum duration is 1-2 months. 4. Treatments may be extended if functional improvement is documented. The request for acupuncture is for a total of 8 sessions. This is in excess of the recommendations. The patient must demonstrate functional improvement in 3-6 treatments for more sessions to be certified. Therefore, the request is in excess of the recommended initial treatment sessions and not medically necessary.

**EMG of bilateral lower extremities (BLE):** Upheld

**Claims Administrator guideline:** The Claims Administrator did not cite any medical evidence for its decision.

**MAXIMUS guideline:** Decision based on MTUS ACOEM Chapter 12 Low Back Complaints.

**Decision rationale:** The ACOEM chapters on low back complaints and the need for lower extremity EMG/NCV states: Unequivocal objective findings that identify specific nerve compromise on the neurologic examination are sufficient evidence to warrant imaging in patients who do not respond to treatment and who would consider surgery an option. When the neurologic examination is less clear, however, further physiologic evidence of nerve dysfunction should be obtained before ordering an imaging study. Indiscriminant imaging will result in false-positive findings, such as disk bulges, that are not the source of painful symptoms and do not warrant surgery. If physiologic evidence indicates tissue insult or nerve impairment, the practitioner can discuss with a consultant the selection of an imaging test to define a potential cause (magnetic resonance imaging [MRI] for neural or other soft tissue, computer tomography [CT] for bony structures). Electromyography (EMG), including H-reflex tests, may be useful to identify subtle, focal neurologic dysfunction in patients with low back symptoms lasting more than three or four weeks. There are unequivocal objective findings of nerve compromise on the neurologic exam provided for review. However, there is not mention of surgical consideration. There are no unclear neurologic findings on exam. For these reasons, criteria for lower extremity EMG/NCV have not been met as set forth in the ACOEM. Therefore, the request is not medically necessary.
